Building DNA: The 3 Genes Myth

Dynamic Factors of Energy Uses

*Taxonomy of data types (dynamic parameters) in a building.
Mantha, Menassa & Kamat, 2015, University of Michigan*

Savings through Building Control

Energy savings from monitoring and controlling HVAC system operations in buildings.

Strategies	Savings	Source
Occupancy-based demand response HVAC control strategy	20%	Erickson and Cerpa, (2010)
Fully integrated building, HVAC, and control simulations	60%	Mathews et al. (2001)

Energy savings from monitoring and controlling plug loads and per appliance power consumption in real time.

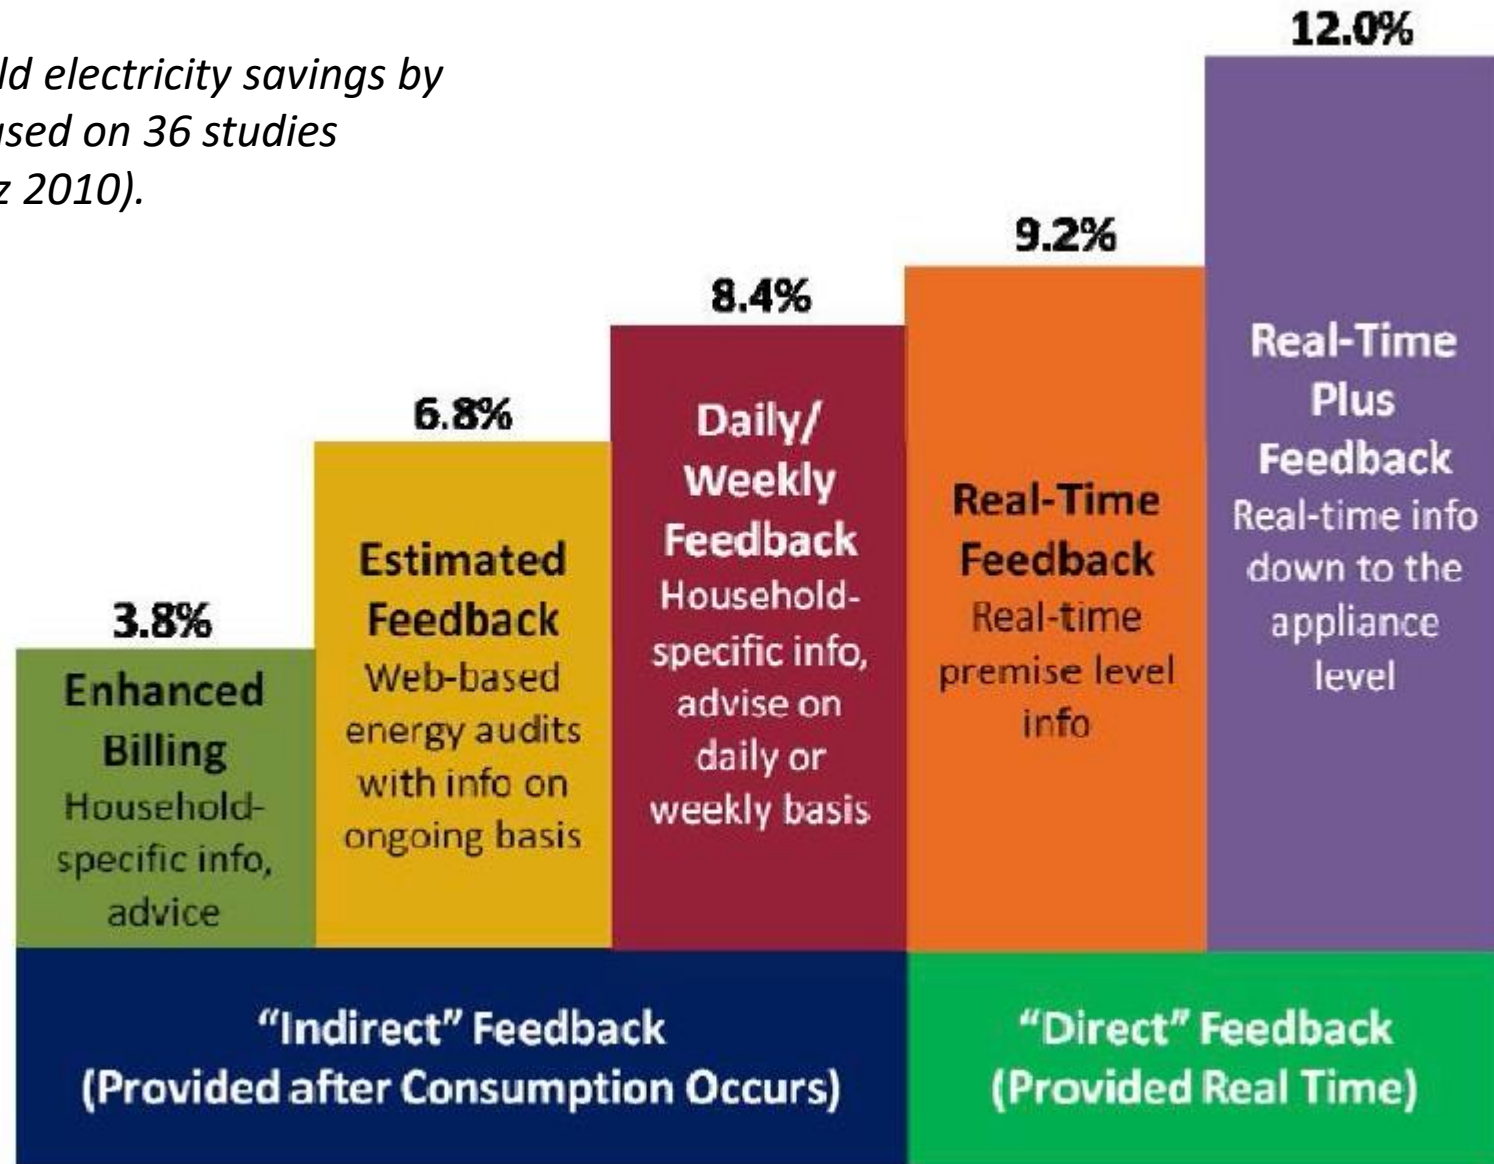

Strategies	Savings	Source
Occupancy-based system	Not quantified	Anastasi, Corucci, and Marcelloni (2011)
HVAC Equipment right-sizing	7–23%	Orland et al. (2014)
Predictive controllers for energy savings	Not quantified	Ruzzelli et al. (2010)
Regulating the indoor set point temperature	43–67%	Ghosh et al. (2013)
Plug load energy management solution	Not quantified	Kim, Schmid, Charbiwala, and Srivastava (2009)
ViridiScope	47%	Lobato, Pless, Sheppy, and Torcellini (2011)
Energy-efficient PPL equipment and design strategies	Not quantified	Schoofs et al. (2010)
Appliance activity monitoring using wireless sensors		

Energy savings from monitoring and controlling lighting

Strategies	Percent of savings	Source
Daylighting	20–80	Chung and Burnett (2001)
Personal tuning: using automatic dimming control for lighting	43	Fernandes, Lee, DiBartolomeo, and McNeil, (2014) and Building Design and Construction [BDC] (2010)
Using occupancy sensors	30	
Multiple types	28–61	

Savings Through User Feedback

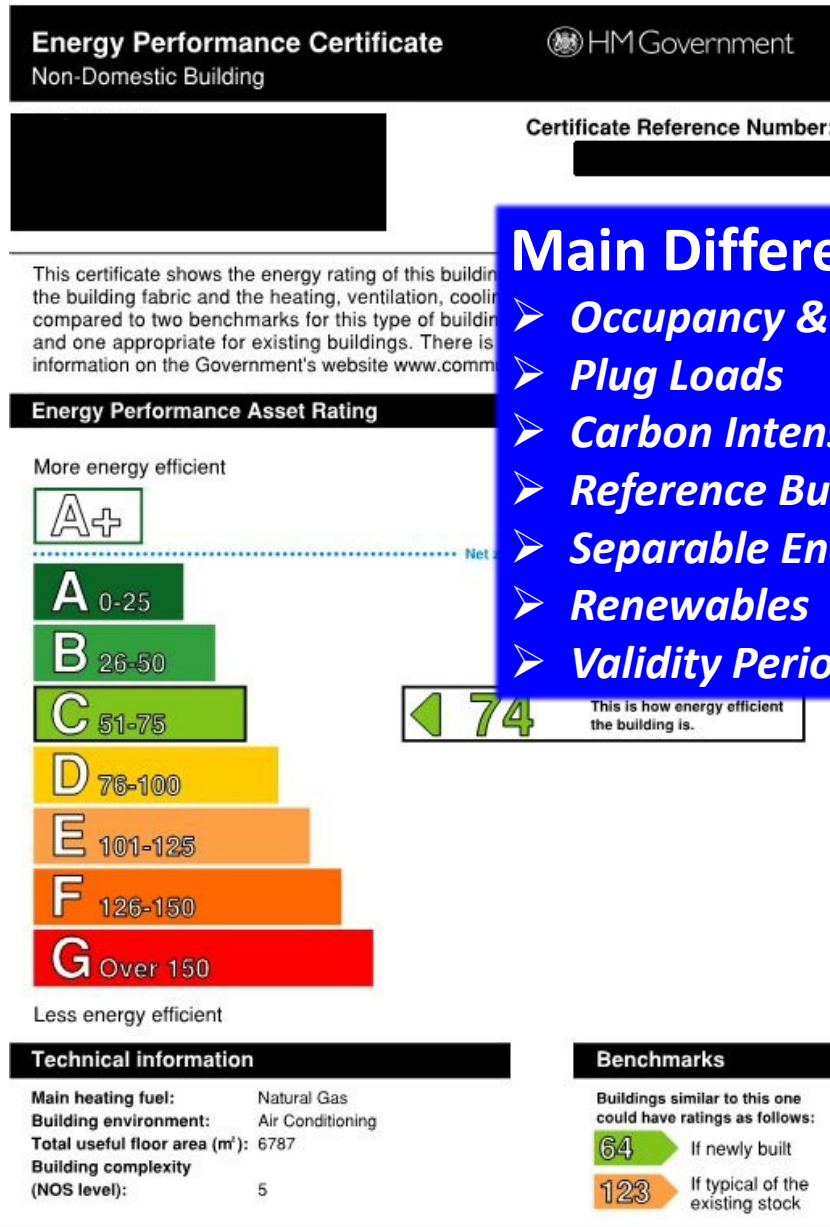

Average household electricity savings by feedback type, based on 36 studies (Erhardt-Martinez 2010).

Energy Performance Certificates

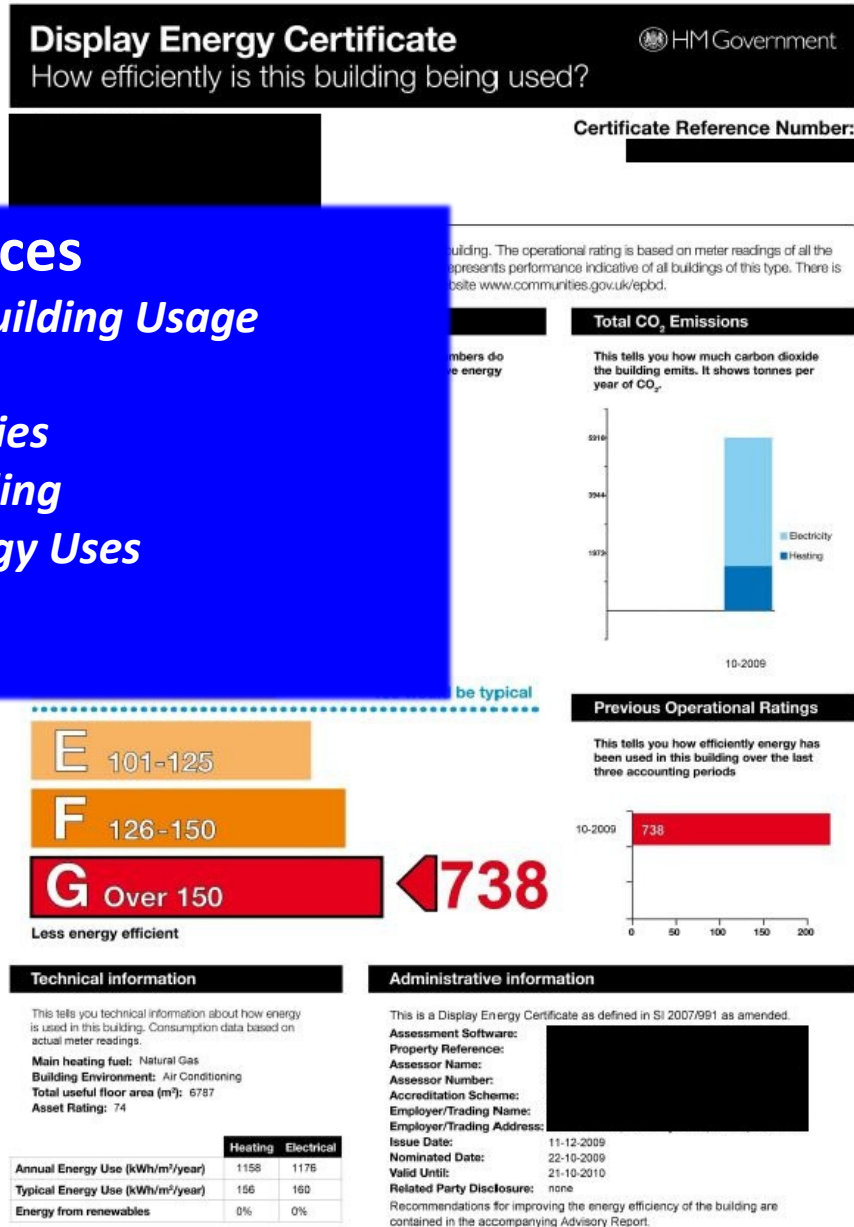

**Asset
Rating**

Main Differences

- Occupancy & Building Usage
- Plug Loads
- Carbon Intensities
- Reference Building
- Separable Energy Uses
- Renewables
- Validity Period

**Operational
Rating**

Operational Rating: What is missing?

Gaps in existing Operational Rating methods

- **Occupancy** (*Average Occupancy Density normalized based on building operating hours*)
- **Ambient Conditions:** *Only HDD are used (no CDD are taken into account) and no daylight information (Pro-Rata Basis Calculation for Lighting)*
- **Organizational Aspects** *not considered*
- **Plug Loads** *(no detailed account of specific types of office loads)*
- **Baselining** *based on Annual Measurements*

The OrbEET Framework

Real Time energy and context data monitoring

Dynamic Baselining

eDECs-Enhanced Display Energy Certificates

*Relevant
Timely
Holistic Feedback*

SENSOR DATA

eDECs

Submetering & Sensor Data
BIM

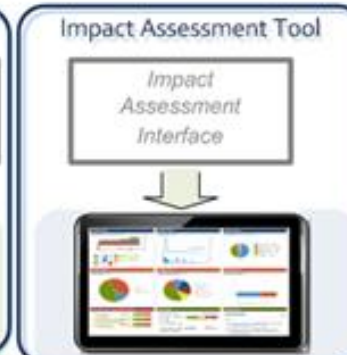

Real-time energy data stream

Space/Time/People-annotated Business Process Models

Dynamic spatial, process-level eDECs

Employee Team 1

Employee Team 2

Engagement / Persistence

Organization & Facility Management

Behavioural Analysts

BUSINESS PROCESS

Incorporation of Building Specific Business Processes

GAMIFICATION

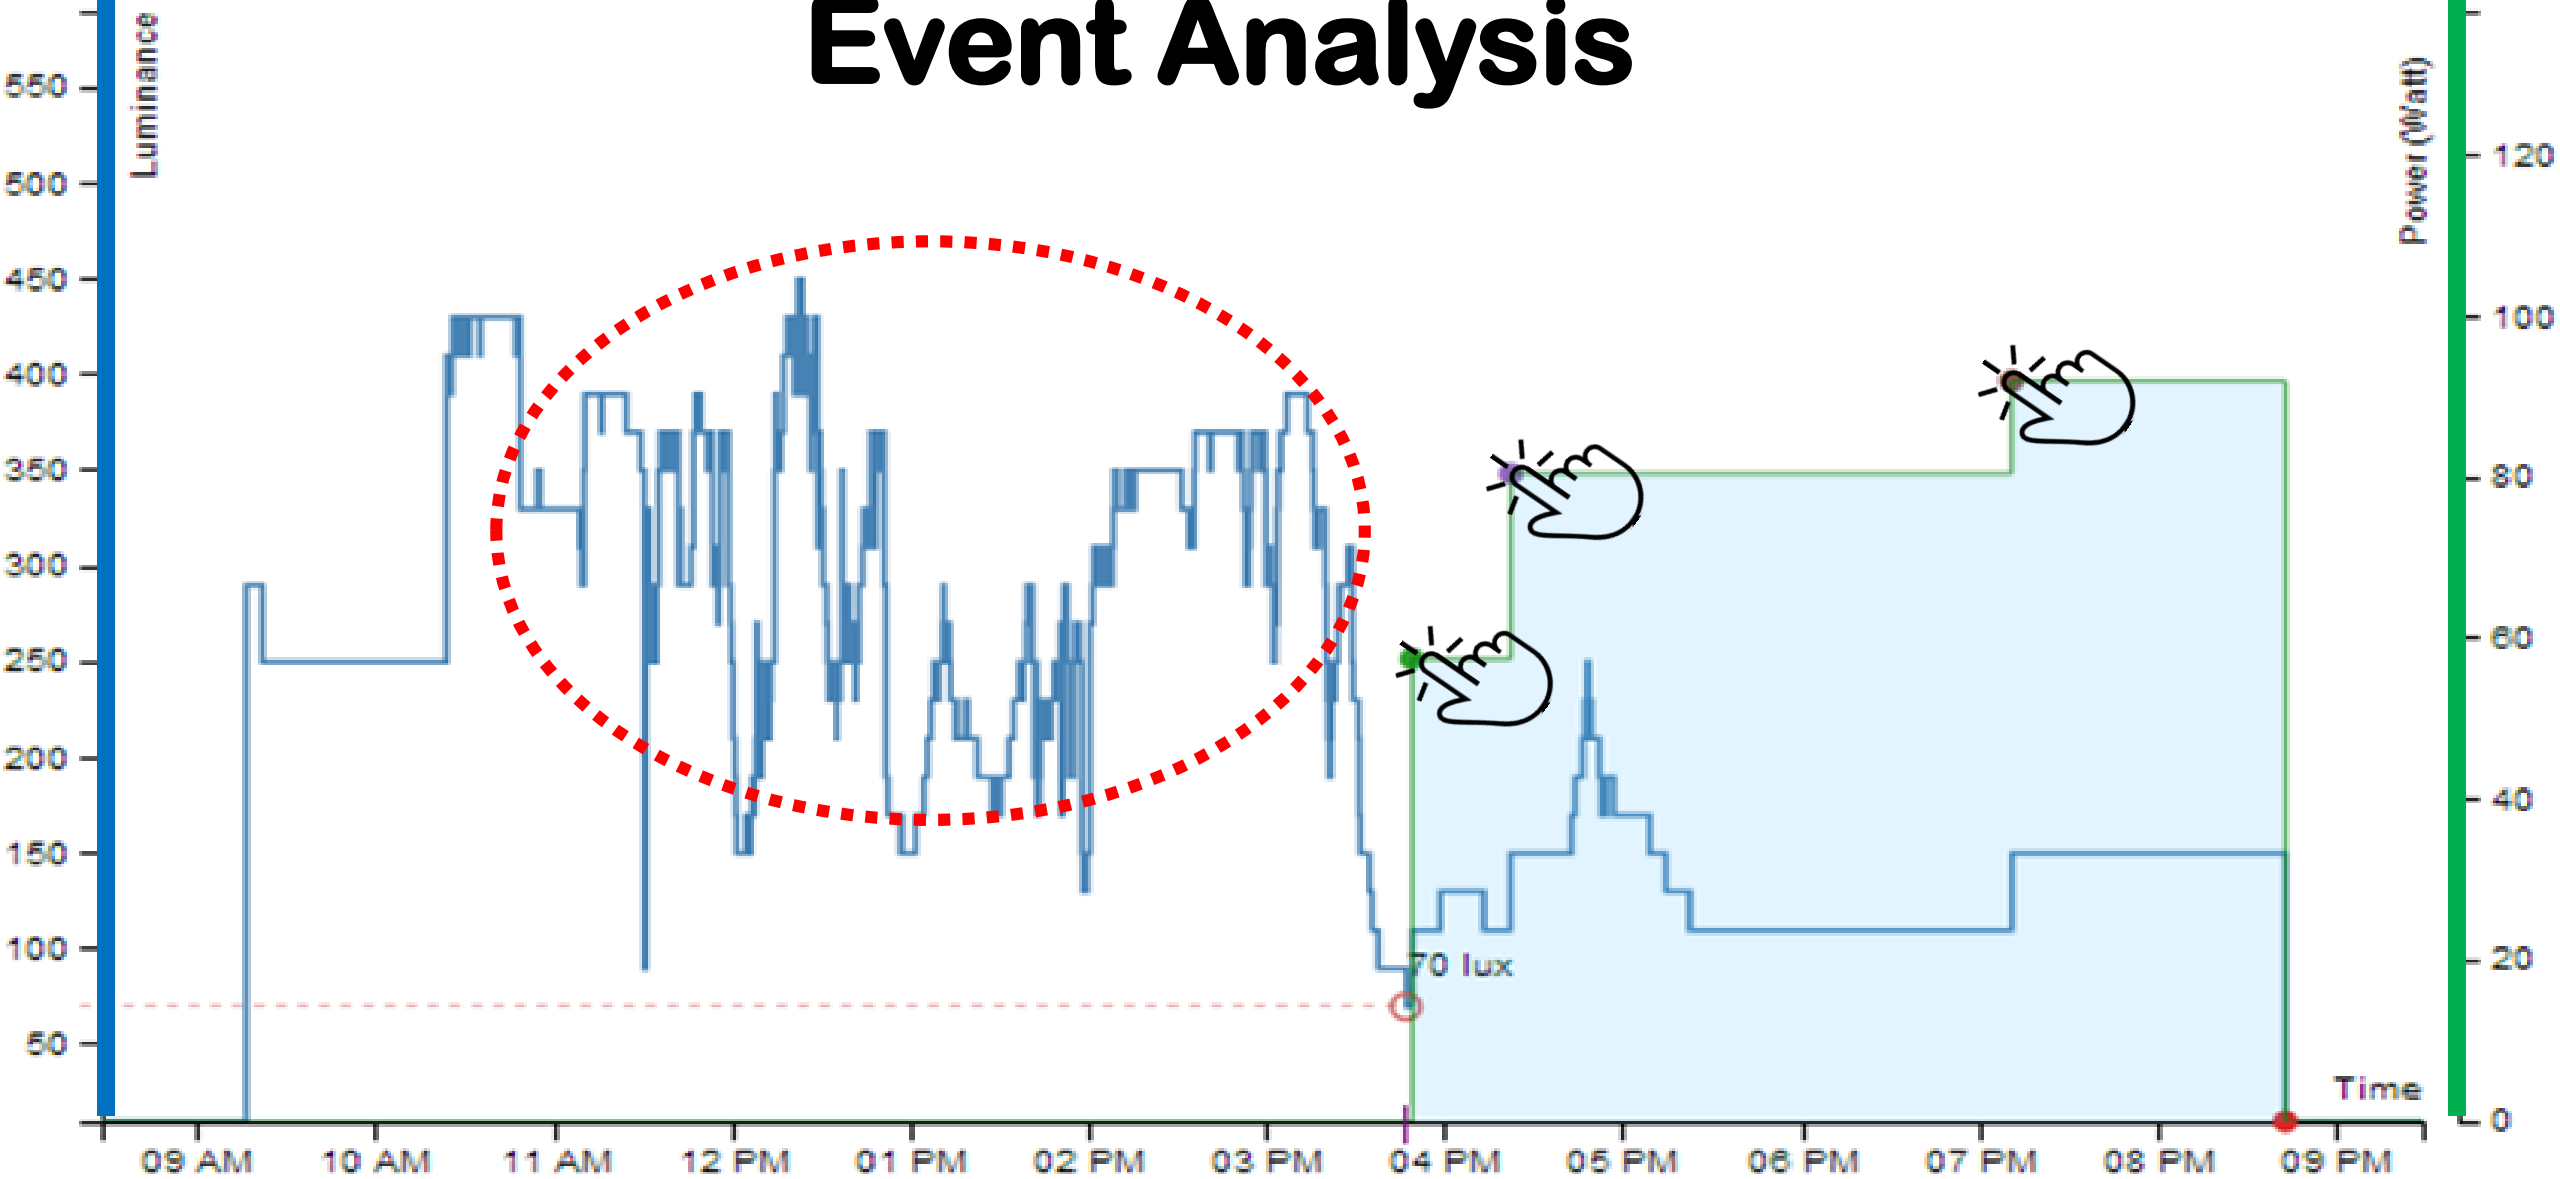

Gamification Tool for behavioural change campaigns

Emotional Design

Illuminance

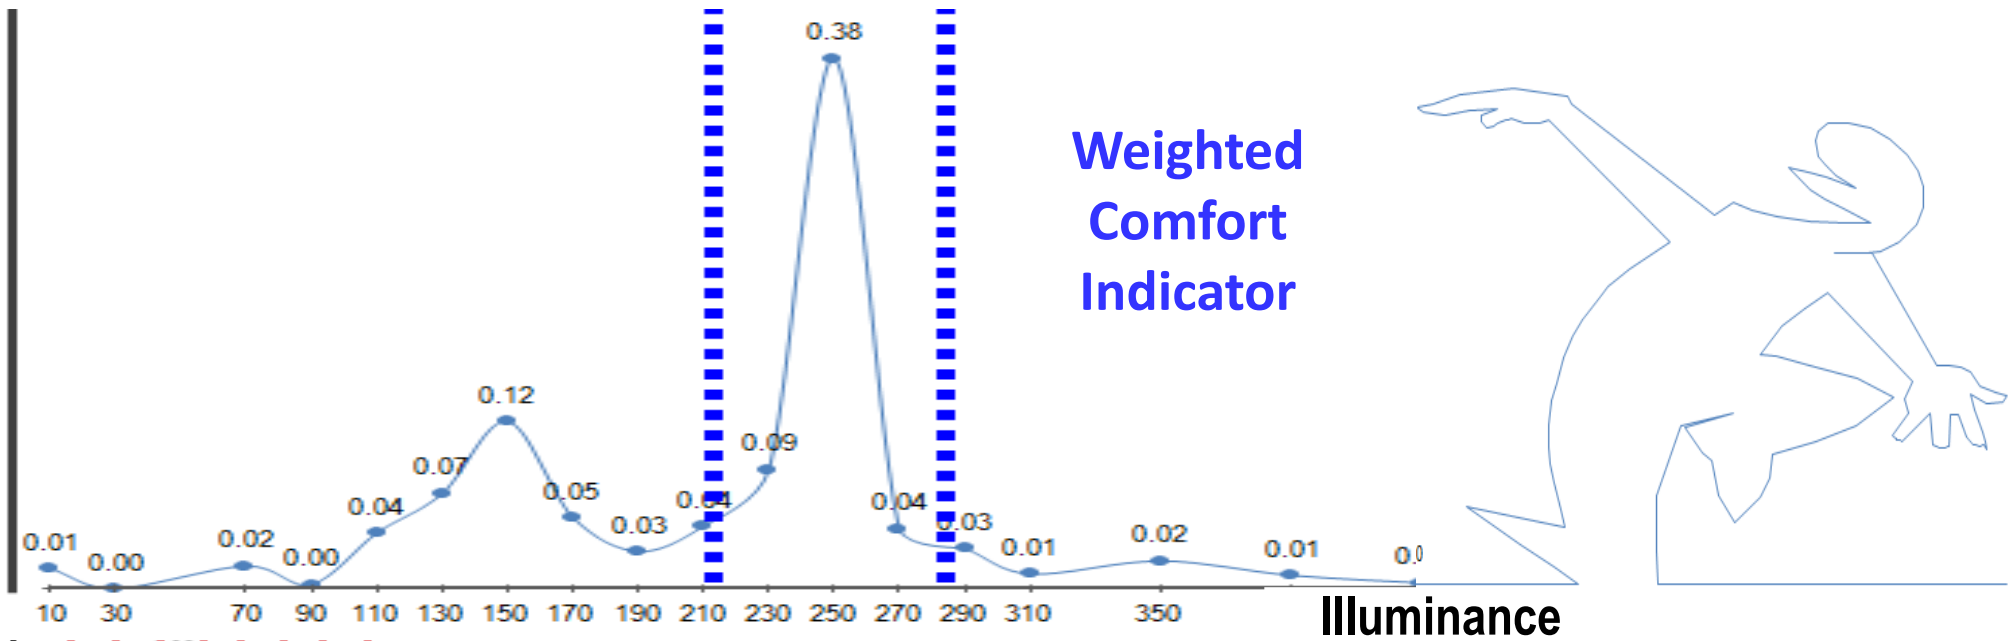

Sensor Fusion & Event Analysis

OrbEET Hybrid Baseline

PROS & CONS OF IPMVP OPTIONS AGAINST ORBEET CHALLENGES

Characteristics	Option B	Option C	Option D	Hybrid
Sub-metering information	X			X
Ability to Assess savings at the level ECM was applied	X			X
Routine and non-routine dynamic adjustments required	X	X		X
Whole facility level (> than 1 ECM)		X	X	X
Prerequisite: Energy savings > 10%		X		X
Performance Measurement based on Energy Simulation			X	X
Low-cost efficient non-intrusive infrastructure		X	X	X
Varying measurement periods per load	X		X	X

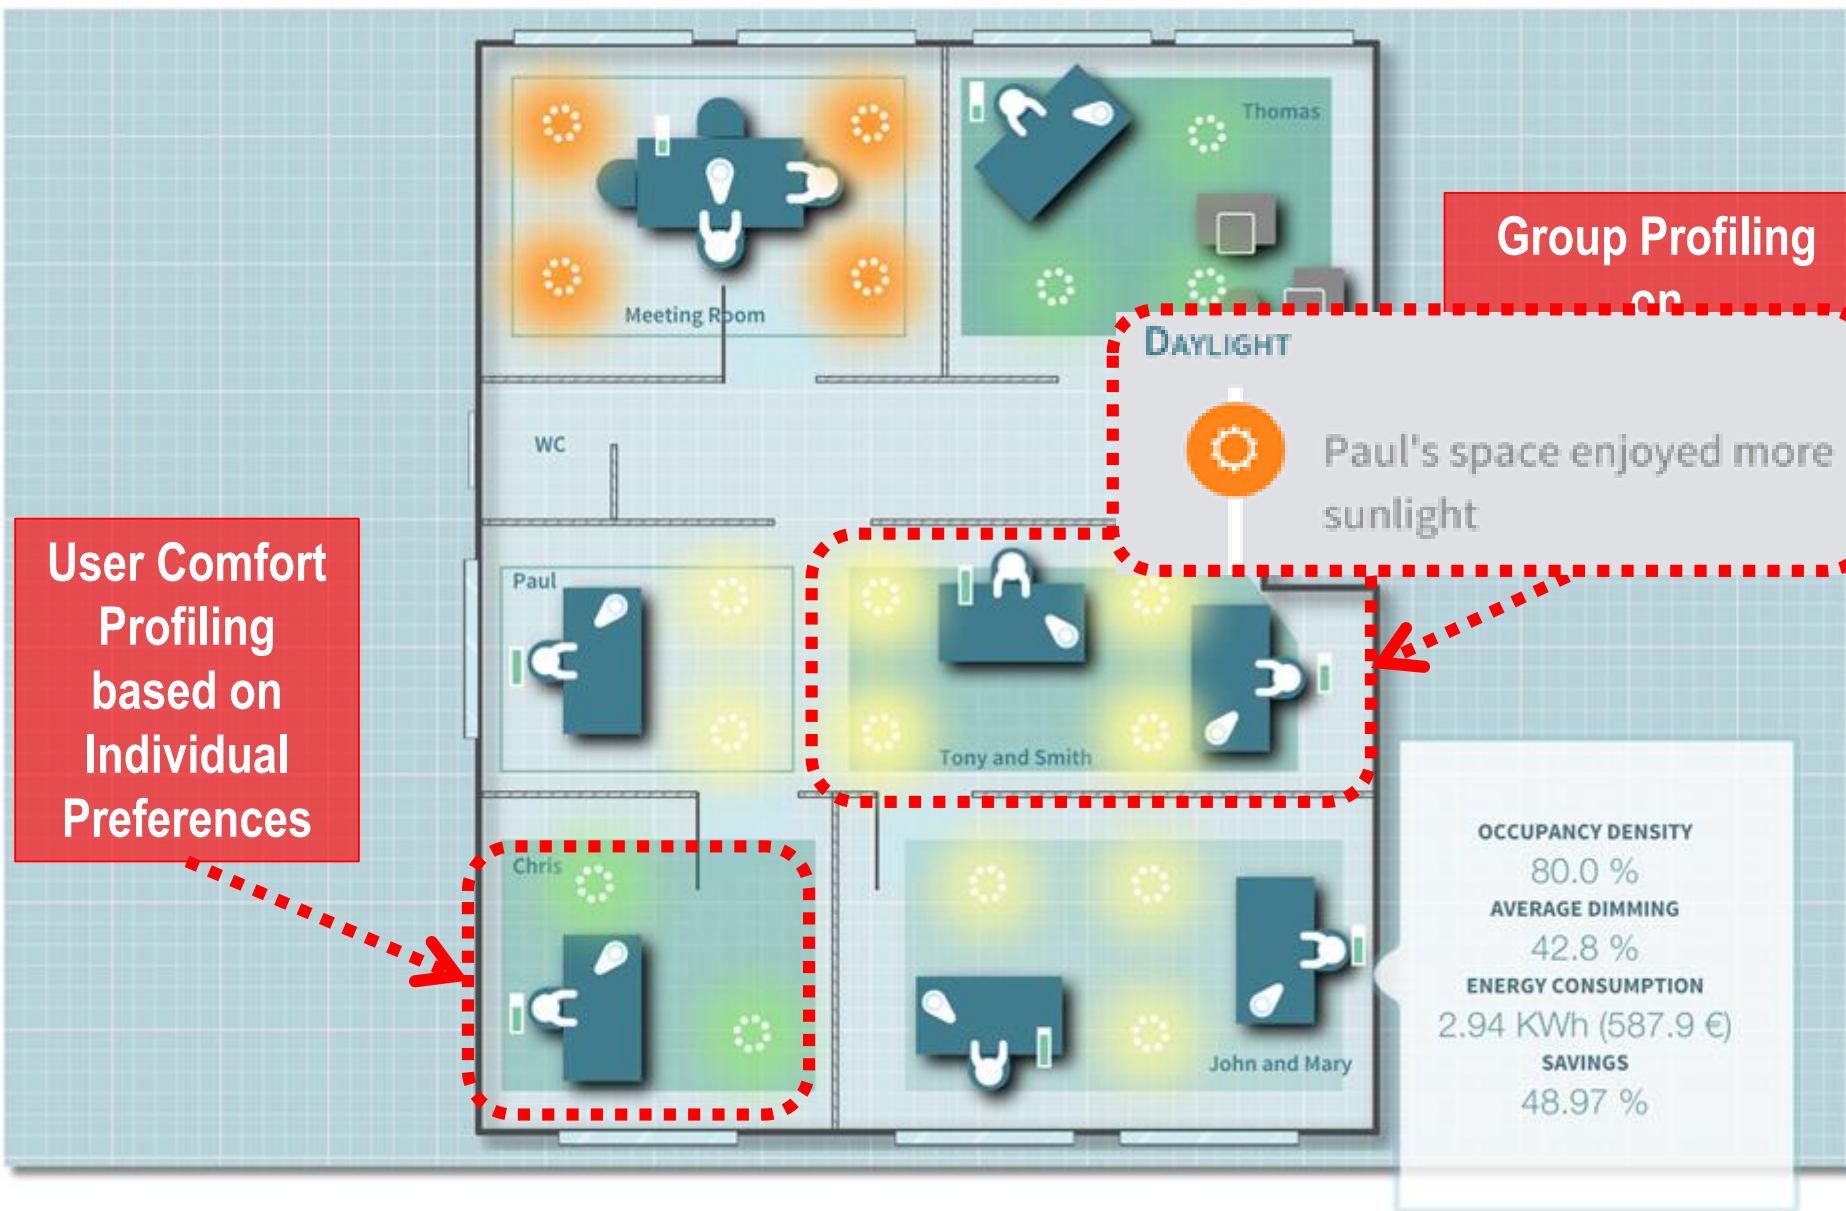

OPERATION MODE ☐

CONSUMPTION ☒

09/11/2015 9:00 AM - 13/11/2015 3:00 PM

PEOPLE

-  Most occupied space was Paul's
-  Brightest space was Meeting Room
-  Darkest space was Thomas's

LIGHTS

-  Meeting Room space used more light
-  Thomas's space used less light
-  Most efficient space was Chris's

DAYLIGHT

-  Paul's space enjoyed more sunlight
-  Tony & Smith space received the least sunlight

 Luminance 368 lux

ENERGY

-  Consumption 590 kWh
-  CO2 emissions 342 kg

OrbEEt Pilot Validation

AUSTRIA

BULGARIA

GERMANY

SPAIN

FUTURE WORK

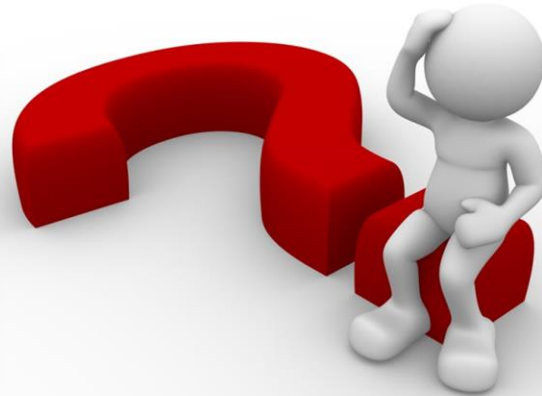

- **Extensive Validation** *focusing on effectiveness, cost-efficiency, user acceptance as well as persistence of effect*
- **Integration with the OrbEEt Behavioural & Gamification Platform**
- **Open Reference OrbEEt Models**
- ***Generic OrbEEt Interfaces for Building Automation***
