Connected Citizens The Smart City Accelerator

Christian MAITRE – Orange

Pieter JANSE VAN RENSBURG- Globetom

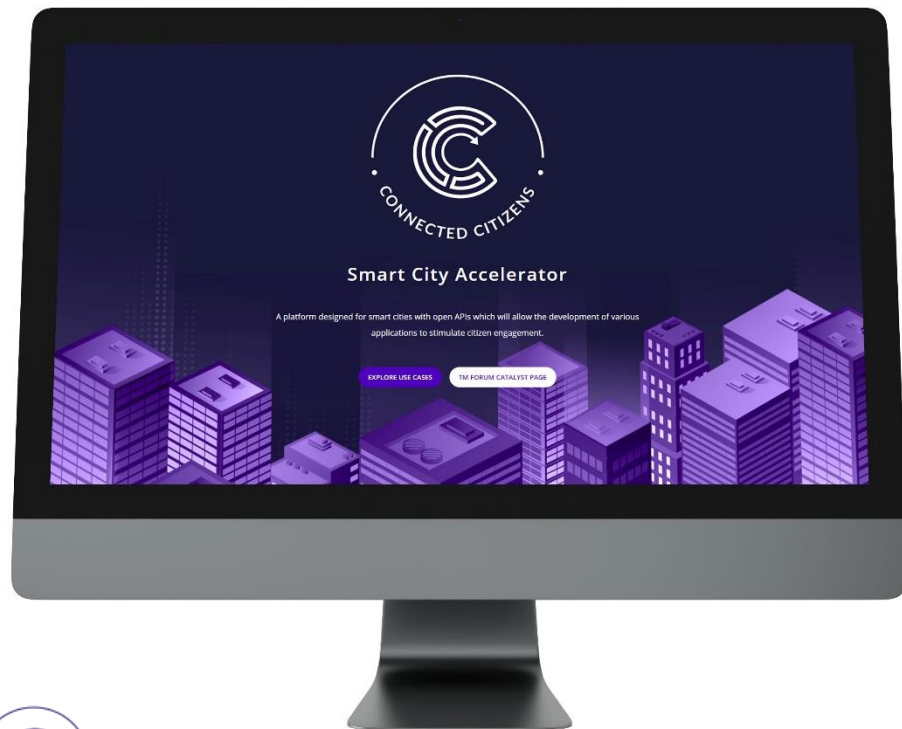

tmforum

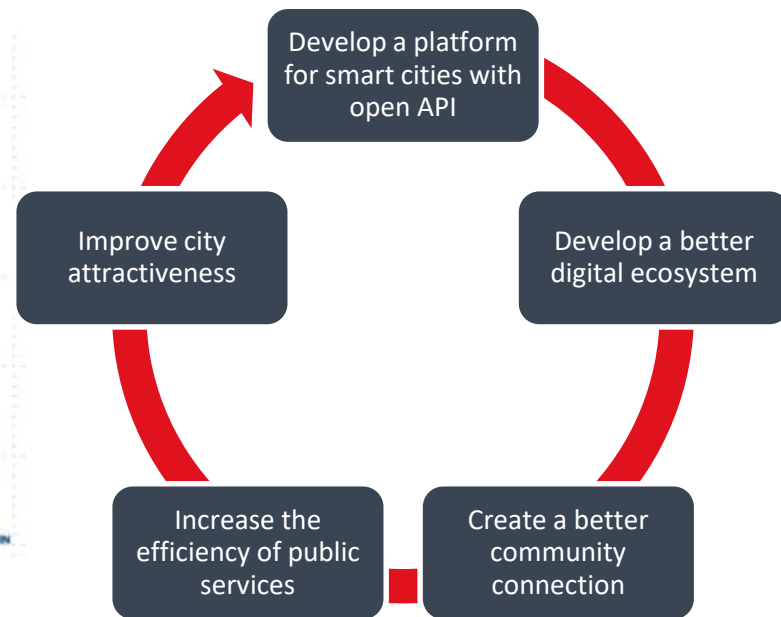

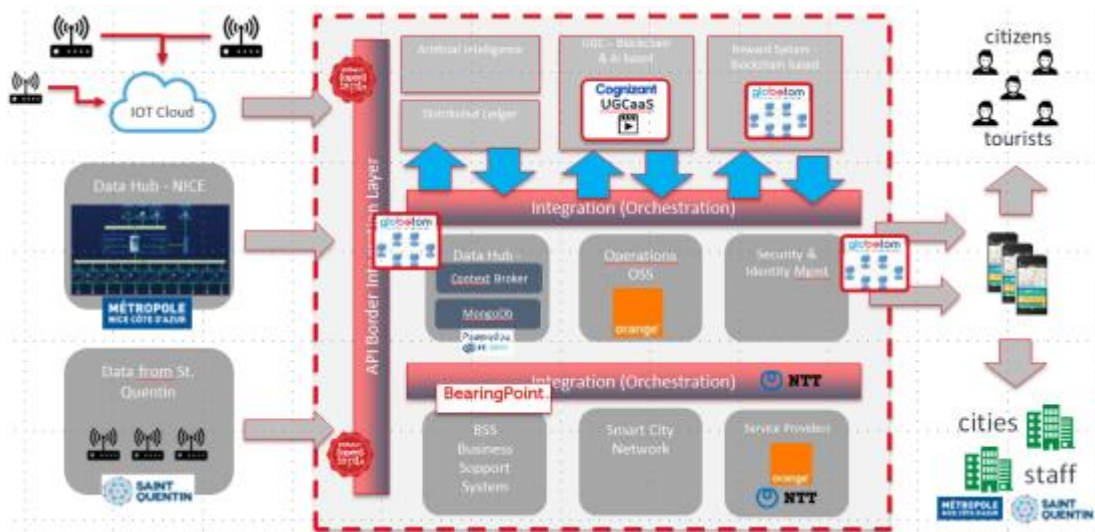

Smart City Accelerator

A platform designed for smart cities with open APIs which will allow the development of various applications to stimulate citizen engagement.

“A unique platform encompassing all technical components required to answer to all city challenges and use cases”

The Key Questions

- Who will pay for any smart city solution, implementation, setup and run ?
- How can we generate revenue ?
- Who pays who ?
- What is the good/best value chain ?
- Is data a good money ?

How to monetize?

- Efficiency, cost cutting
- Value addition
- New revenue generation

A complex ecosystem

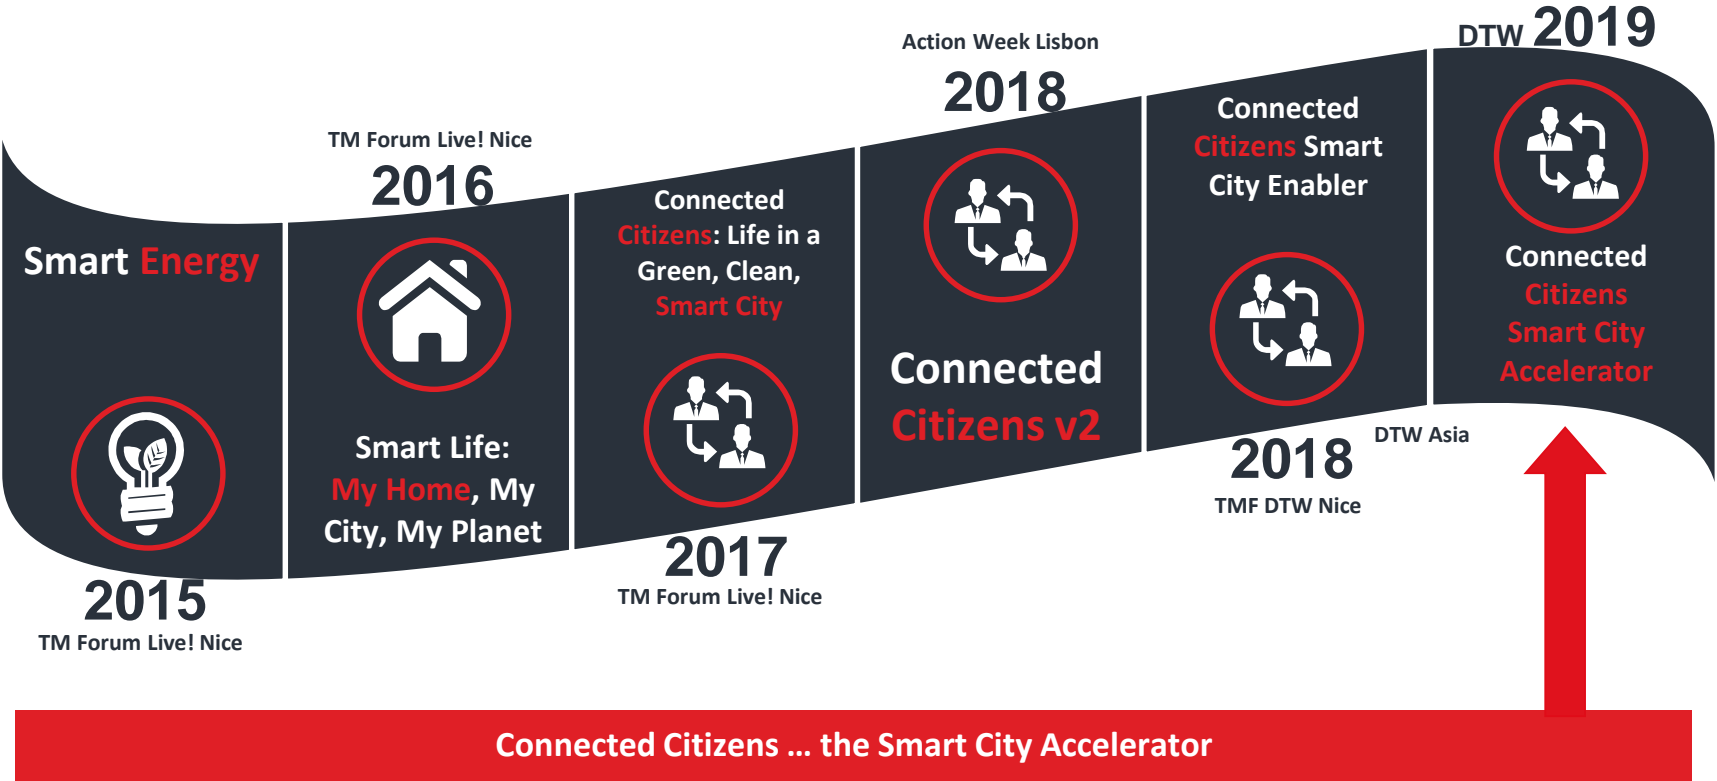

- Public service
- Private sector
- Universities
- Associations

euro value**

Catalyst History and Timeline

Our goals

The context

A long history of non converging solutions, a growing complexity with digital, an always bigger pressure on finance but the time is the good one now to start or restart on a smart city journey

- Cities are **facing a proliferation** of digital techniques and concepts to solve each of their concerns. There is very little convergence and synergy between these solutions. This is a reminder of what other areas may have encountered before any standardization...like Telco in the 80's
- With dozens of past and current experiences, cities have expressed their **great difficulty** in obtaining real levers to find tangible, scalable and sustainable results for their problems and especially for the interoperability of the solutions implemented.
- On top of this, Cities are today facing **problems to finance** these solutions with no efficient business models or revenue models, and are facing the digital wave without big levers to be embarked.

Smart solutions are fueled by disruptive technologies and social innovations

Most new technologies and social innovations are disruptive on their own. The combination of them is even more powerful and creates a 'perfect storm' of disruption.

 **Cloud** - on-demand access to rich application functionality and computing power allow for exponential scalable solutions in a "pay-per-use" model

 **Mobile** - ubiquitous mobile internet, powerful mobile devices and apps with intuitive interfaces act as front end for many innovative solutions

 **Social media & Digital platforms** - use digital technology to connect people in new and powerful ways forming the basis of new collectives and communities

 **Big data** - large volumes of highly volatile and rich data (structured data, sensor data, audio, video, social media) form the lifeblood of smart solutions

 **Artificial intelligence** - cognitive systems combine machine learning with the ability to interact via natural language and create insight from data

 **Internet of things** - physical objects equipped with advanced sensors and connectivity transform into smart objects and generate a plethora of data

 **Robotics and drones** - smart robots and drones replace human labor on a large scale, not only for routine work but increasingly for providing services

 **3D printing** - additive manufacturing allows for efficient production of unique products where and when they are needed

 **Blockchain** - algorithm that facilitates registering transactions in an indisputable way without the use of an intermediary or a central administration

 **Renewable energy** - New sources of energy like photo voltaic cells and energy from wind and water are an alternative to large scale generation based on fossil fuel.

 **Co-creation** - an initiative that brings together parties to jointly create a mutual valued outcome. In the context of smart cities, these are (communities of) citizens, private companies, knowledge institutes and public organizations that form an ecosystem to solve societal problems in a creative way.

 **Crowd sourcing** - the process of obtaining needed services, ideas, or content by soliciting contributions from a large group of people, and especially from an online community, rather than from traditional employees or suppliers.

 **Sharing economy** - using information technology as an enabler to bring together supply and demand in new ways. Use digital platforms to share and reuse excess capacity in a variety of goods and services.

 **Gamification** - the use of game thinking and game design elements (competition, levels, leaderboards, badges, etc.) in non-game contexts. The objective of gamification is to stimulate people to change their behavior. In a desired way.

 **Self organization** - a process where overall order and coordination arises out of the local interactions between people in an initially disordered system. It is spontaneous and not necessarily controlled by any auxiliary agent. The resulting organization is wholly distributed and typically robust.

41 Smart Cities - A Deloitte Point of View, Version 1.0

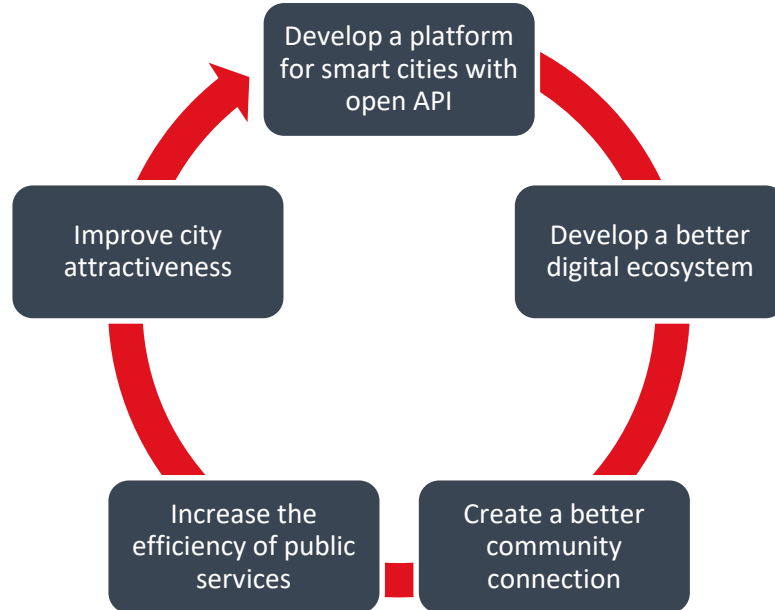

© 2015 Deloitte The Netherlands

It is the good time : technology is here,
mindset has changed, need is really here

The solution

A new mutualized, open digital platform at the center of a business ecosystem to answer the cities needs of today and tomorrow

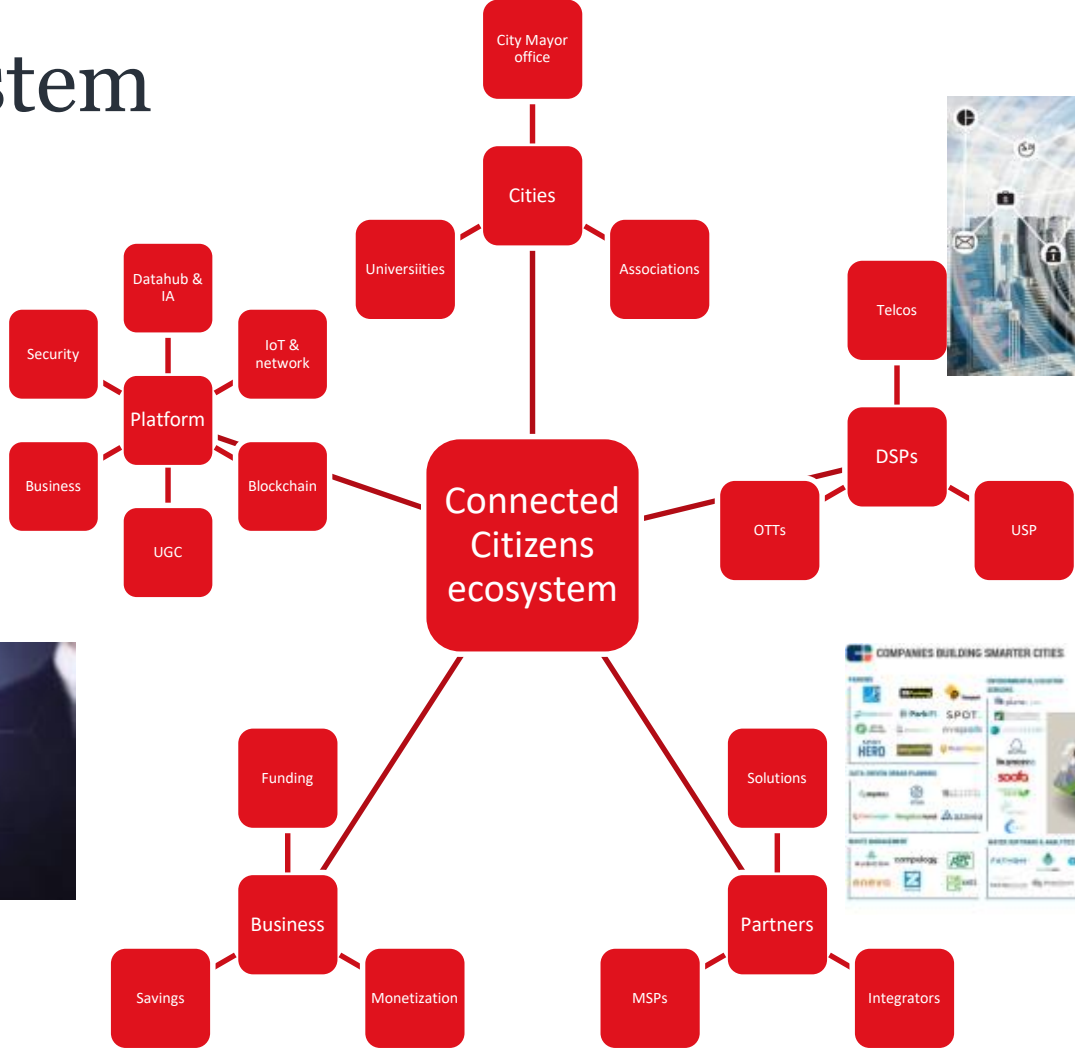

Connected Citizens builds the draft for the global ecosystem for small and medium cities to develop their smart city capabilities. The platform aims to enable city stakeholders, such as developers, city agents, students and citizens to collaborate for the development of the smart city “context” as well as for large developers or integrator to produce scaled up horizontal solutions

Our vision is not only to provide a platform but also to assist cities to become autonomous on the digital transformation. We will integrate an ecosystem vision with local public and private partners. They will be able to propose a valuable, efficient digital environment to develop their own ambition.

That ecosystem will enhance the public services efficiency, create a new dynamic of engagement of citizens. At the end of the loop the ambition is to attract new citizens, companies, students ... to enable a more robust city with better funding capacities and a better image.

The ecosystem

City Stories examples to validate the scenario

City Stories

MÉTROPOLE
NICE CÔTE D'AZUR

The weather forecast for the next few days heralds heavy rain.

Roger needs to monitor river levels to prevent flood risk. To better manage the risks, he also needs to have information about upcoming events at the nearby auditorium.

 **SAINT
QUENTIN**

Alexandre is responsible of green spaces of the city of Saint-Quentin. His concern is to use data to monitor the watering system of sport fields in order to optimize water consumption and tour of municipal staff.

NYC

Mike is an emergency service coordinator for New York City (NYC). Today there are high winds and he is concerned about impacts to emergency services teams, traffic and citizen safety.

City of Sapporo

Taka is responsible of ICT usage to solve the problems in the city of Sapporo. His concern is to make use of the data from IT to understand the tourist move and purchase behavior in order to encourage local business.

Use Cases

User Generated Content
with Blockchain

Third Party / Innovator
Onboarding

Decision Making Based
on IoT Events

Expose and Track Existing
Data Through APIs

Smart City IoT Device and
Event Management

Vertical Stretch from Smart City Through Platform

Needs		Smart City	Smart Transportation	Smart Environment	Smart Education	Smart Factory	...
CCC responses							
Technical	Smart City IoT Device & Event Management	Sustainable /Efficient /Attractive city	Parking Sharing	Saving Monitoring	Learning Teaching Certifying	Innovating Quality control	
	Expose and Track Usage of Existing City Data through APIs						
	Decision Making Based on data IOT Events						
	Third-Party / Innovator Onboarding						
	User Generated Content with Blockchain						
Operational	Onboarding Party & Provisioning						
	Ordering & Activation						
	Quality & Problem Mgt.						
	Billing & Settlement						

Business Models

World is changing ... some cities will emerge, some will explode

Skynet

Borderless Remote Health Care: A Reality with 5G

As recent history has proven, **epidemic outbreaks** are still happening frequently, even in well developed countries and **swift, coordinated handling is crucial**: pandemic influenza, bird flu, swine flu, Nipah and Ebola still have a global impact.

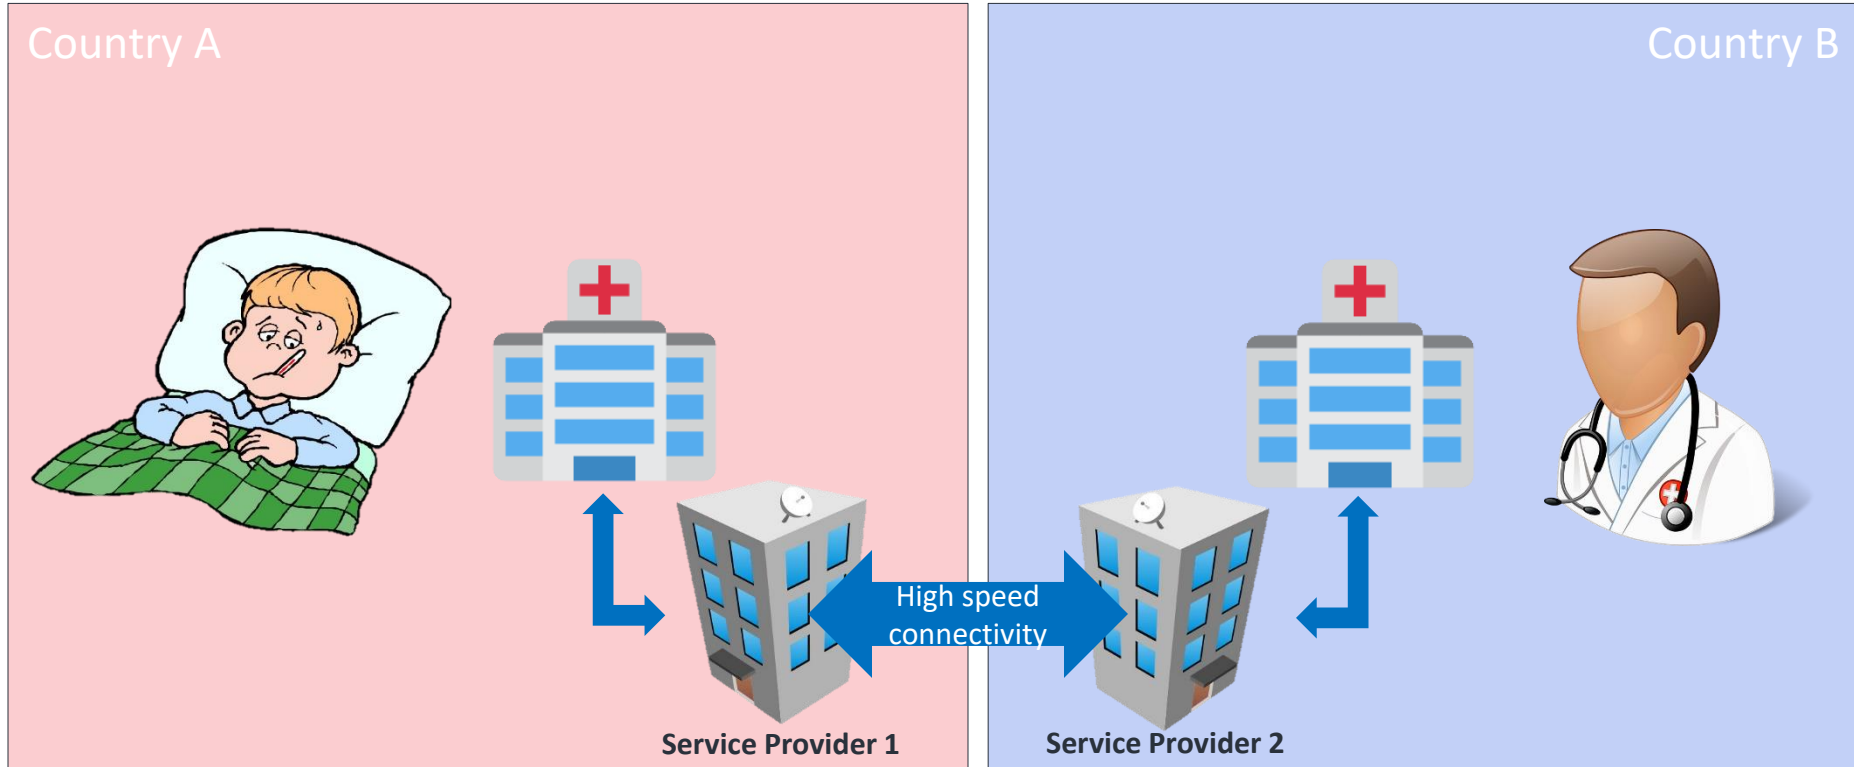

How telecoms can help the eHealth sector?

The Skynet model can ultimately enable an **unprecedented medical collaboration** around the globe.

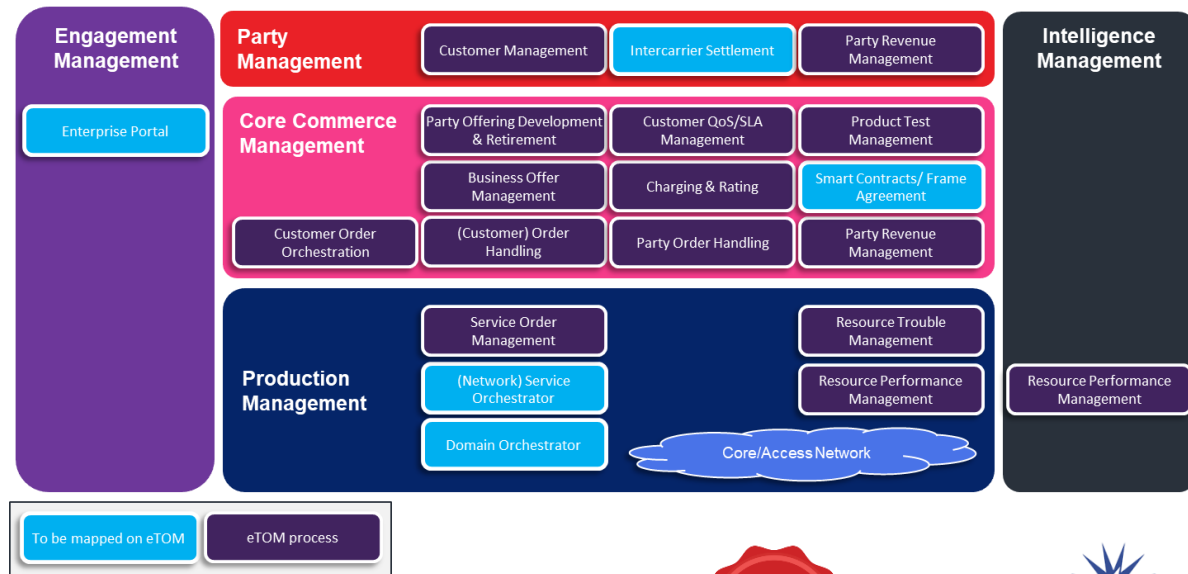

But what happens when they are in different locations?

And advanced connectivity for advanced medical services

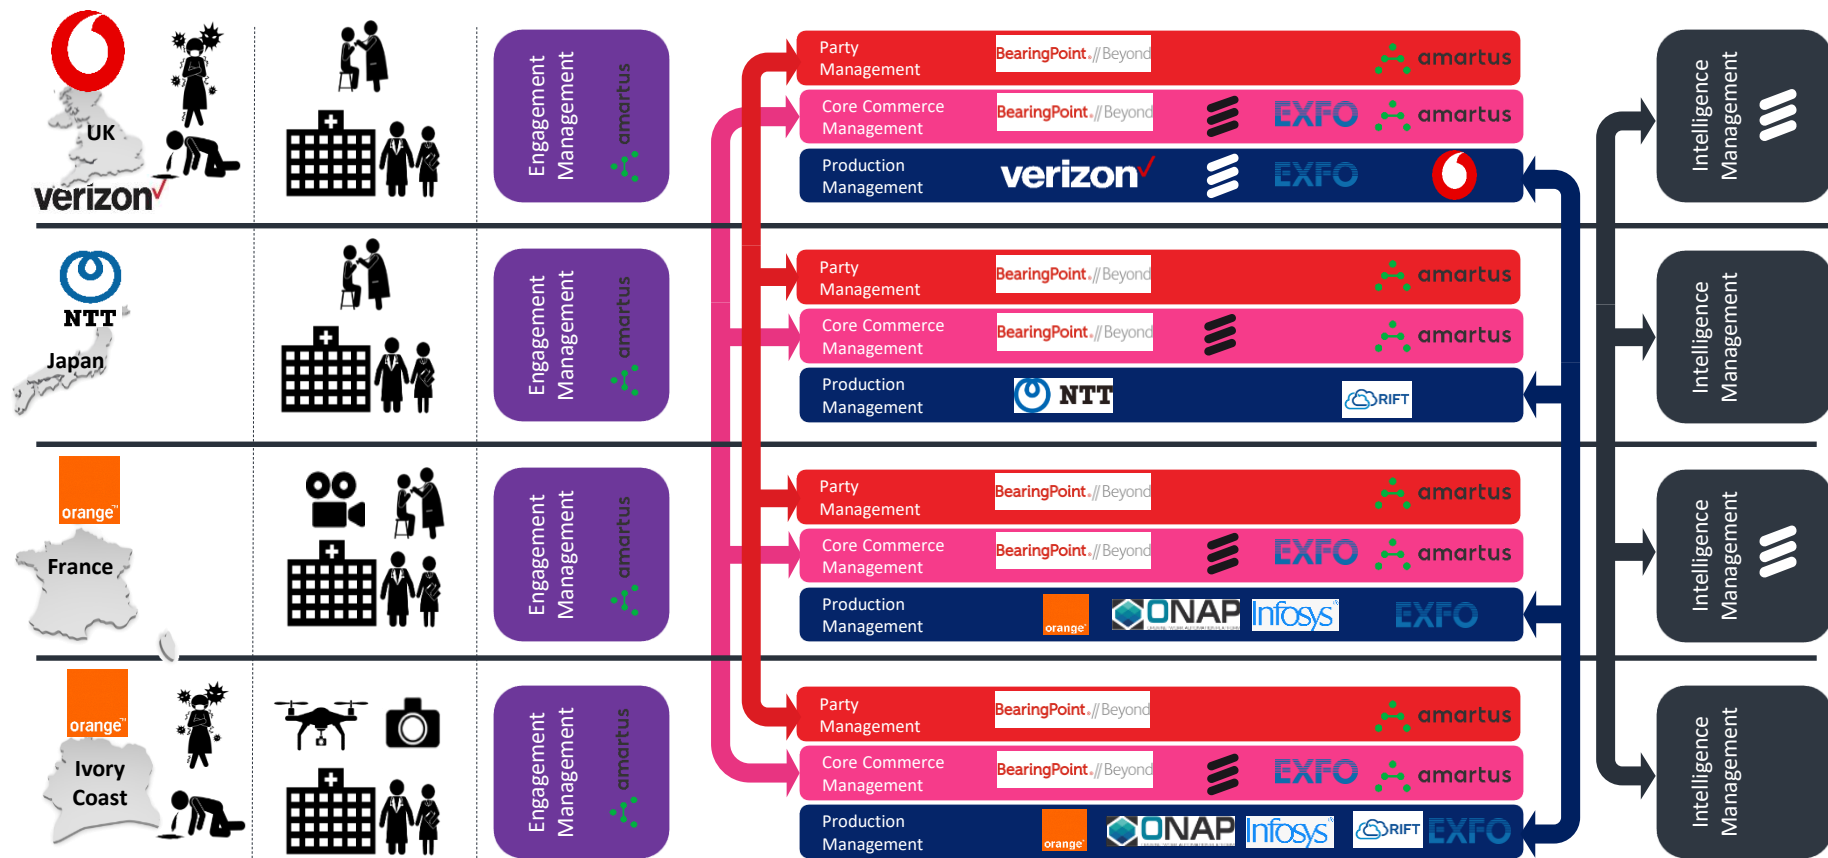

Industry standards

Industry standards are key as they enable collaboration and **easy(er) integration of new partners**, a mandatory requirement to enable a worldwide health platform collaboration.

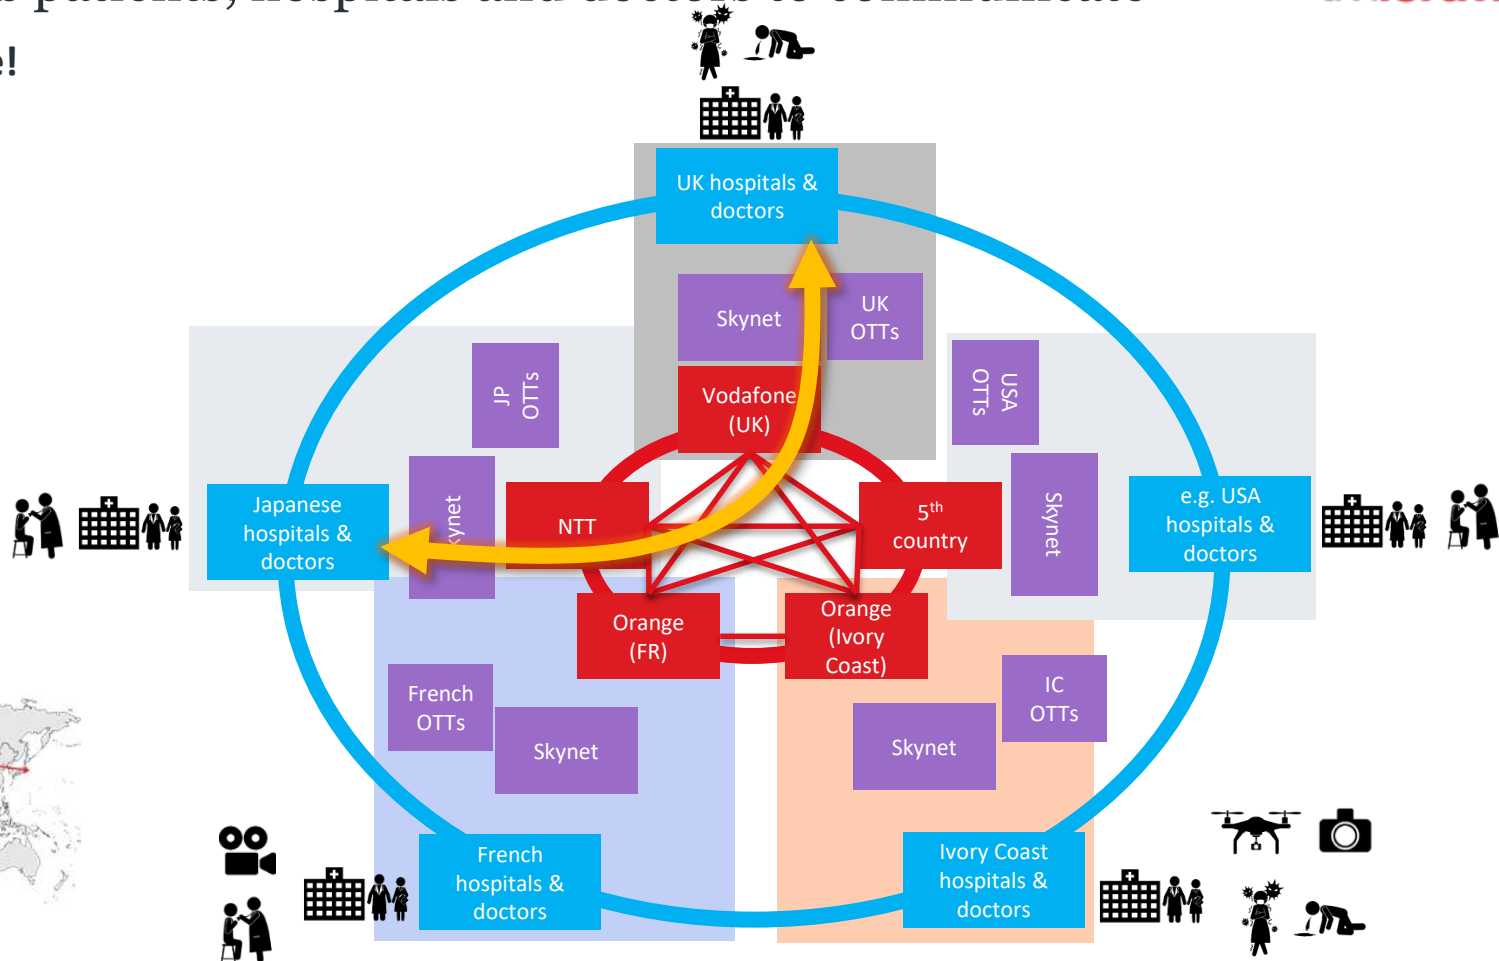

High level ODA Skynet intercarrier architecture and applications

Skynet enables patients, hospitals and doctors to communicate

Wherever they are!

11 Champions' and 6 vendors

Incredible collaboration for next generation eHealth!

settlement

Using 5G network slicing to provide new tools to save lives!

- The knowledge doctors need often is available far away from the location of need, making telecoms a central enablement component.
- Skynet is providing:
 - **On demand inter-carrier hybrid network slices orchestration** that go across operators & country borders.
 - **Inter-carrier Assurance**
 - **Inter-carrier Charging and Billing settlement**
 - **A powerful business model** to manage all the parties involved
- The solution set up can actually be used as a blueprint to address **every business vertical** that requires high performing network slices going across operators and geographies

Thank you!
