# Galileo: The European GNSS enhances location performance for IoT

*IoT Week 2019*

Omar Valdés Market Development Officer at European GNSS Agency

*Aarhus, June 2019*

**GALILEO** **EGNOS**  
NAVIGATION SOLUTIONS  
POWERED BY EUROPE

# Several technologies can provide positioning capabilities relevant to locate “things”

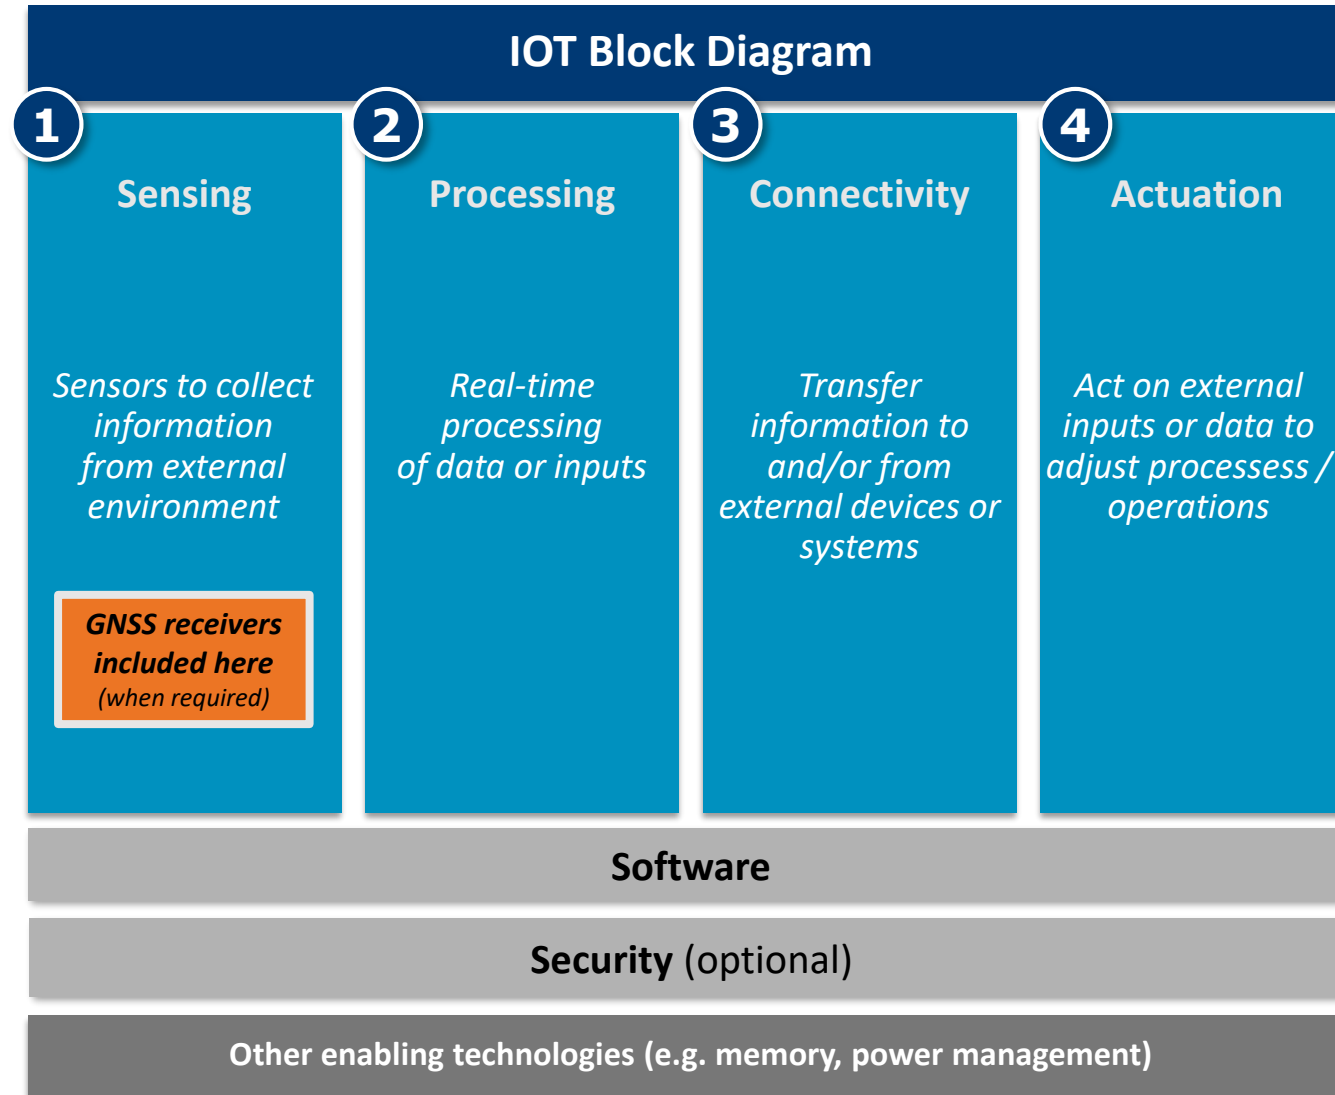

Main absolute positioning technologies and accuracy

	Indoor	Outdoor	Accuracy
Network based	Cell-ID		200-5000m
	Cell Tower Triangulation		50-1000m
Handset based		GNSS	1 - 50m
Hybrid		A-GNSS	
Infrastructure based	Wi-Fi		3-10m /20-50m
	Bluetooth		3-10m
	UWB		20 cm-10 m
	RFID		<3m

- **Network based:** (Cell-ID, E-OTD, TDOA etc.) using the telecommunication networks
- **Handset based:** (GNSS) the handset itself is the primary means of positioning the user. The A-GNSS corresponds to a hybrid technology based on the GNSS but using the cellular network
- **Infrastructure based:** (Bluetooth, UWB, Wi-Fi or RFID) the position is computed by evaluating of the distance between the device and transmitters (for example a Bluetooth beacon or a Wi-Fi router)

# Internet of Things is developing alongside 4 building blocks where sensing is the enabler

# Current GNSS is not enough... emerging applications are more and more demanding in terms of performance

Augmented reality

Self-driving cars

Drones

Smart cities

Automation on the farm

Antifraud applications

# Improving GNSS-based location (1/2)

Multi-constellation for more availability of the signals

Supported constellations by GNSS receivers<sup>2</sup>

<sup>2</sup> shows percentage of receivers capable of tracking 1, 2, 3 or all the 4 GNSS constellations

Multi – constellation is already widely used in many applications but is **not yet a standard in IoT**

Usual combination of GPS and Glonass is now expanded with Galileo and Beidou

R&D progress enabled multiple constellations to work together **without much impact on the power consumption**

# Improving GNSS-based location (2/2)

First dual frequency chipsets now available for the mass market

Available today:

Announced prototypes:

## Multi-frequency for better accuracy of the position

Supported frequencies by GNSS receivers<sup>2</sup>

<sup>2</sup> shows percentage of receivers capable of tracking 1, 2, 3 or all the 4 frequencies

# E5/L5: The second frequency of choice

Wide band signal providing increased **accuracy**

Exceptional resistance to **multipath**

In combination with E1 providing **iono-free** solution

All constellations support this frequency, the number of available signals will grow rapidly

E1/E5 combination is recognized in **all segments**, professional, automotive and also mass market

Future GNSS/RNSS common frequencies, showing the potential of E5a/L5 and of E1/L1 combination

	L5 / L5OC / E5a / B2a	L2 / L2C / L2OC	E6 / LEX	L1 / L1OC / E1 / B1
GPS	30	30		30
GLONASS	24	24		24
Galileo	30		30	30
BeiDou	35		35	35
QZSS	3	3	3	3
IRNSS	7			
	129	← ARNS* Bands →		122

Frequency band used by the system, with N = number of satellites

Frequency band not used by the system

\* ARNS = Aeronautical Radio Navigation Service: Frequency bands allocated worldwide to GNSS on a primary basis, granting a better protection against interference

# Galileo can contribute with innovative features to IoT

- Authentication

- Data level: [Navigation Message Authentication](#)

Integrated in the E1-B band for OS. Aimed at consumer users and offered for free.  
Already prototyped and under testing

- Range level: [Signal Authentication](#)

Based on the E6-C Spreading Code Encryption to protect against more sophisticated attacks

# Galileo OS Navigation Message Authentication

“Navigation Message Authentication” is the ability of the system to guarantee to the users that they are utilising legitimate navigation data that has not been modified and comes from the Galileo satellites and not from any other source (spoofing).

Clear **differentiator w.r.t. other GNSS** available to the civil community

Fully **backward compatible**

Disseminated on the first Galileo frequency (**E1B**)

Contributes to **mitigate GNSS vulnerabilities**

No need to store secret keys in the Rx, just public key

Follows crypto standards and recommendations to be secure over the next decades

# Galileo OS-NMA can add value to multiple markets

The use of OSNMA is expected to **reduce the associated spoofing risk** in many applications categories:

Road  
(AD, PAYD, RUC)

Logistics  
(proof of delivery)

Mobile  
payments

Internet of  
Things

Timing &  
Synchronisation

Commercial Marine

Augmented Reality

UAV

*Not exhaustive list.....*

# Galileo High Accuracy Service on E6 to be offered for FREE

User positioning accuracy with **decimeter level error** ( $\approx 20\text{cm}$ )

**No need of additional** ground communication **channel** (*448 bps allocated on Galileo E6B*)

**No need of proximity to base stations** to access corrections (*as opposite to RTK*)

**Triple frequency** to further **increase accuracy** and **reduce PPP convergence time\***

Improved line-of-sight and **better coverage** at high latitudes

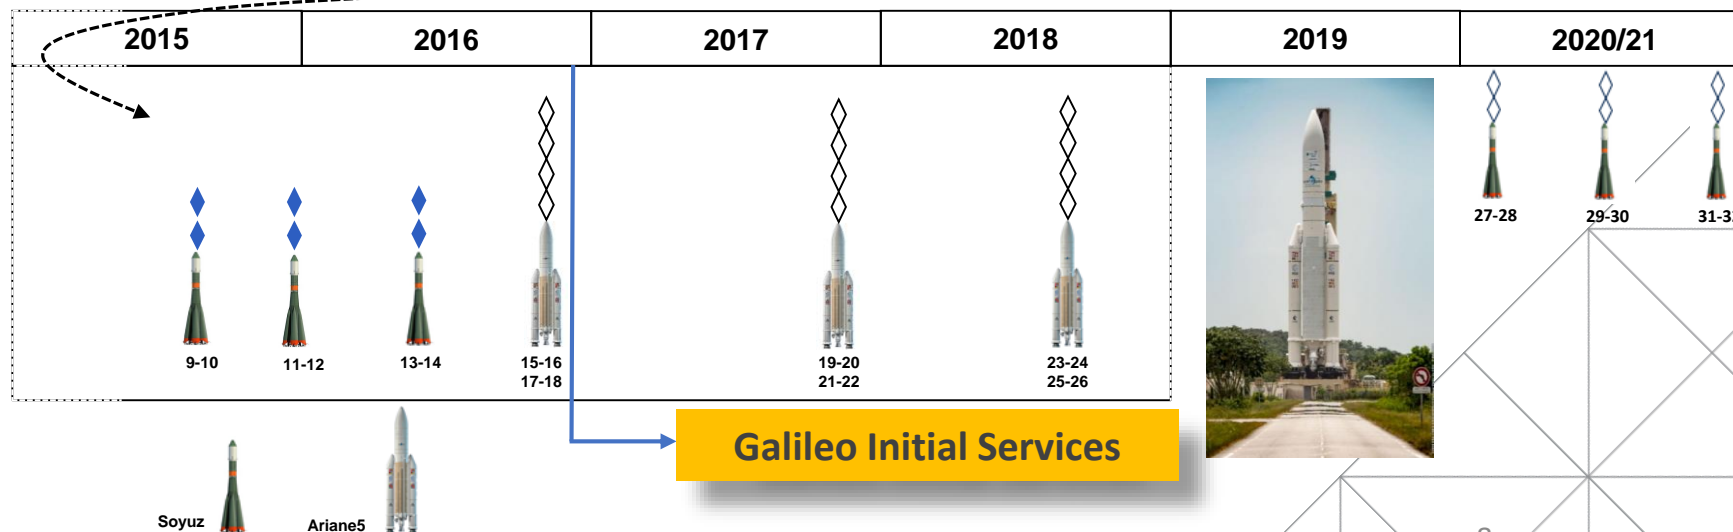

\* It will require compatible receivers E1/E5/E6

# Can we use Galileo right now?

Short answer: **Yes!**

- Galileo operational since 2016
- 26 satellites already launched
- 22 satellites are usable
- 12 more satellites procured

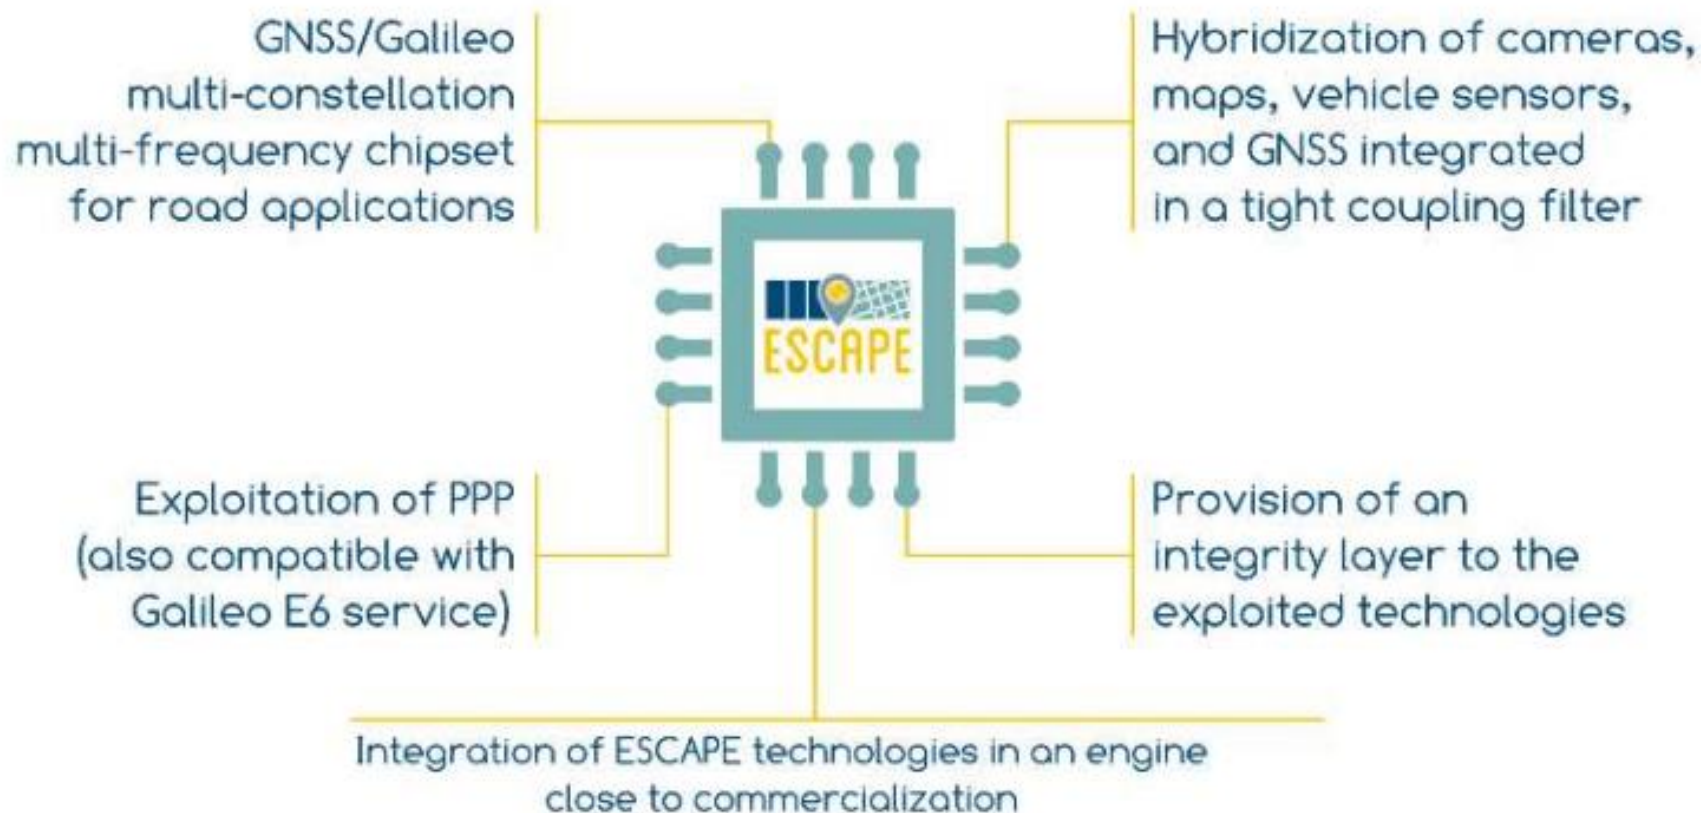

# First dual frequency phone was launched in 2018

# Example of implementation of a dual frequency positioning module for autonomous driving

GSA funded project ESCAPE that develops a highly automated positioning engine

# Galileo-enabled devices are already available

**TIMING**  
 **spectracom**  
Synchronizing Critical Operations

**Leica**  
Geosystems

**SMARTPHONES/MASS MARKET**  
 **intel** **QUALCOMM** **BROADCOM** **MEDIATEK**

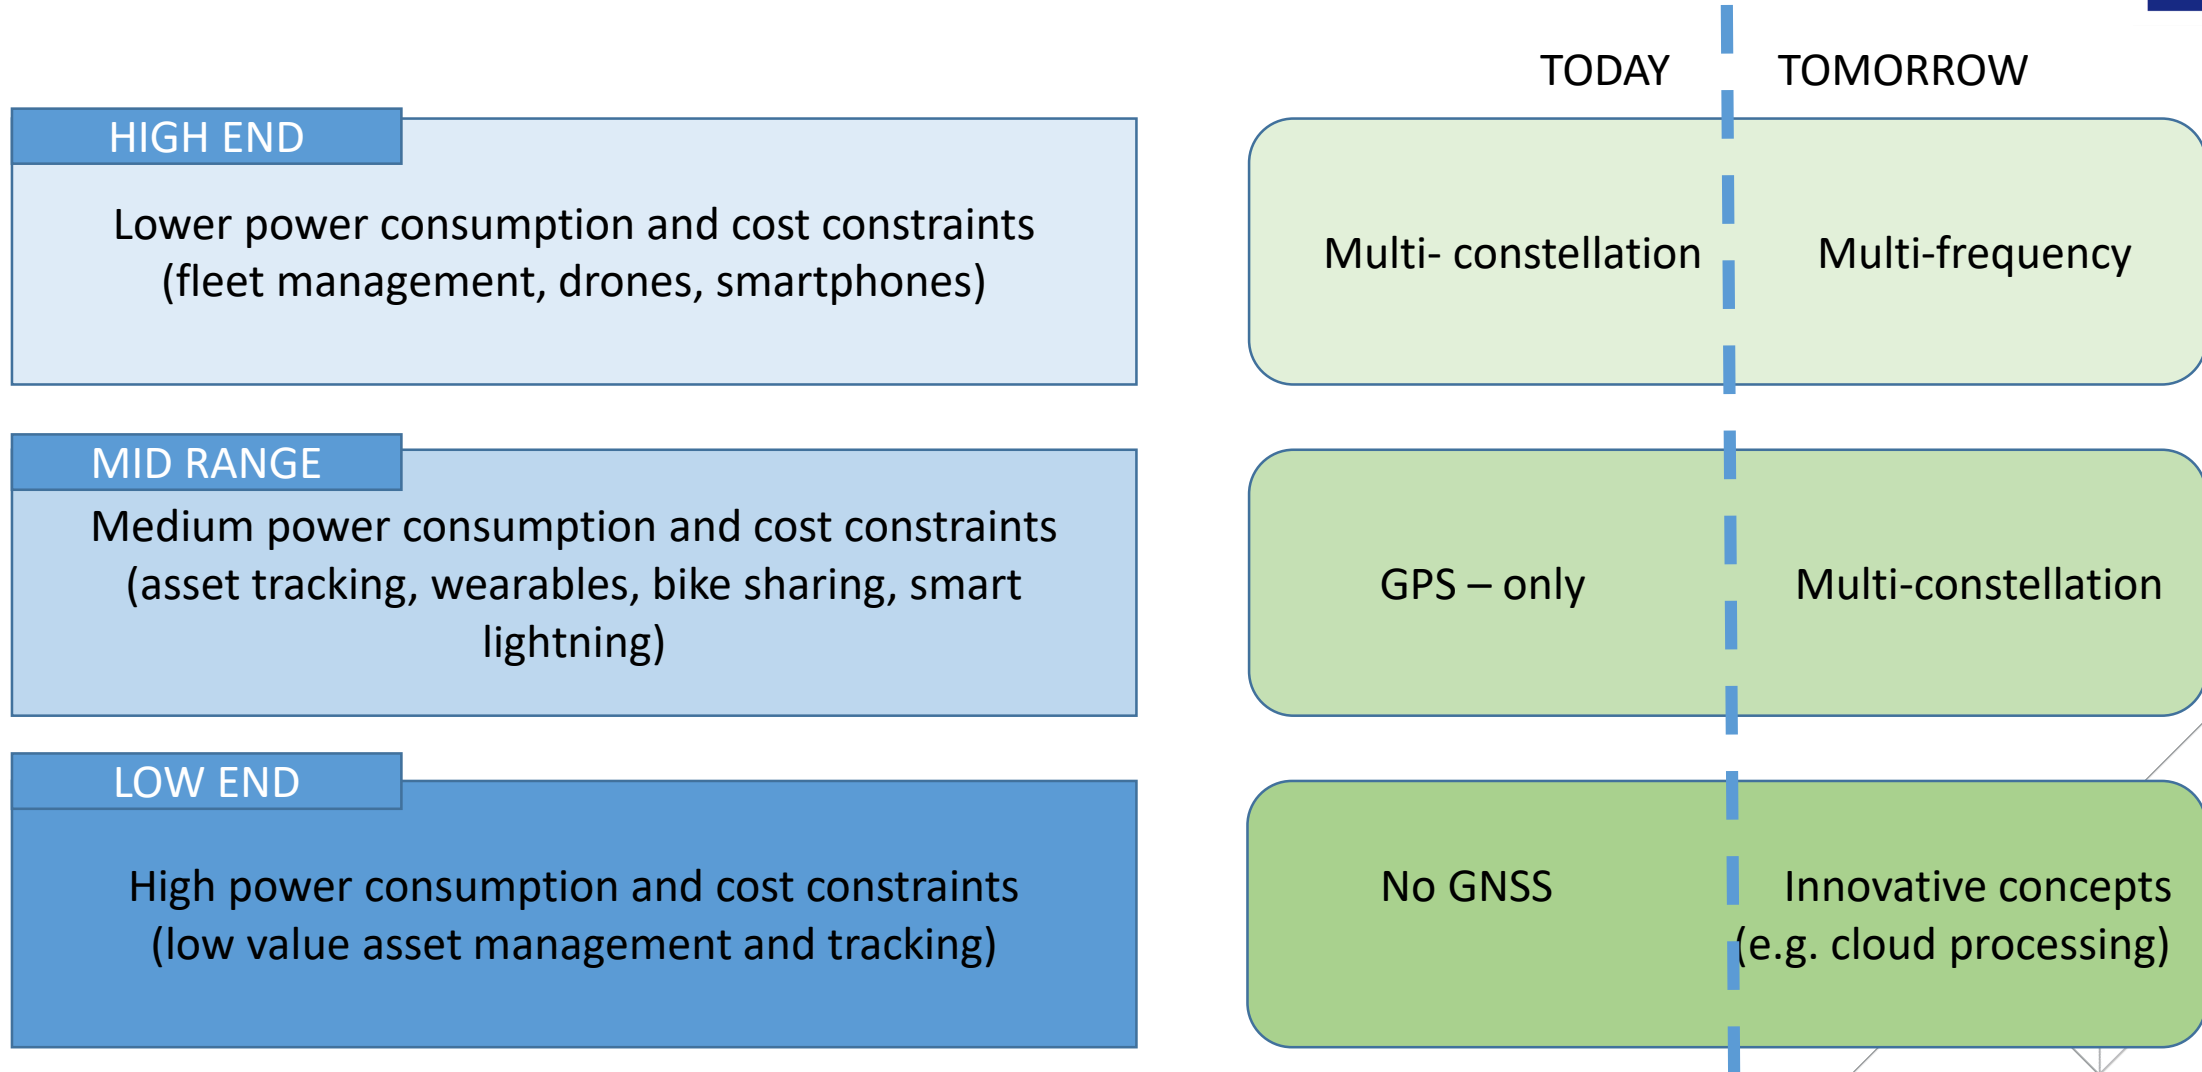

**AUTOMOTIVE**  
 **STMicroelectronics** **CSR QUALCOMM** **u-blox**

**UAVs**  
 **THALES** **FURUNO**

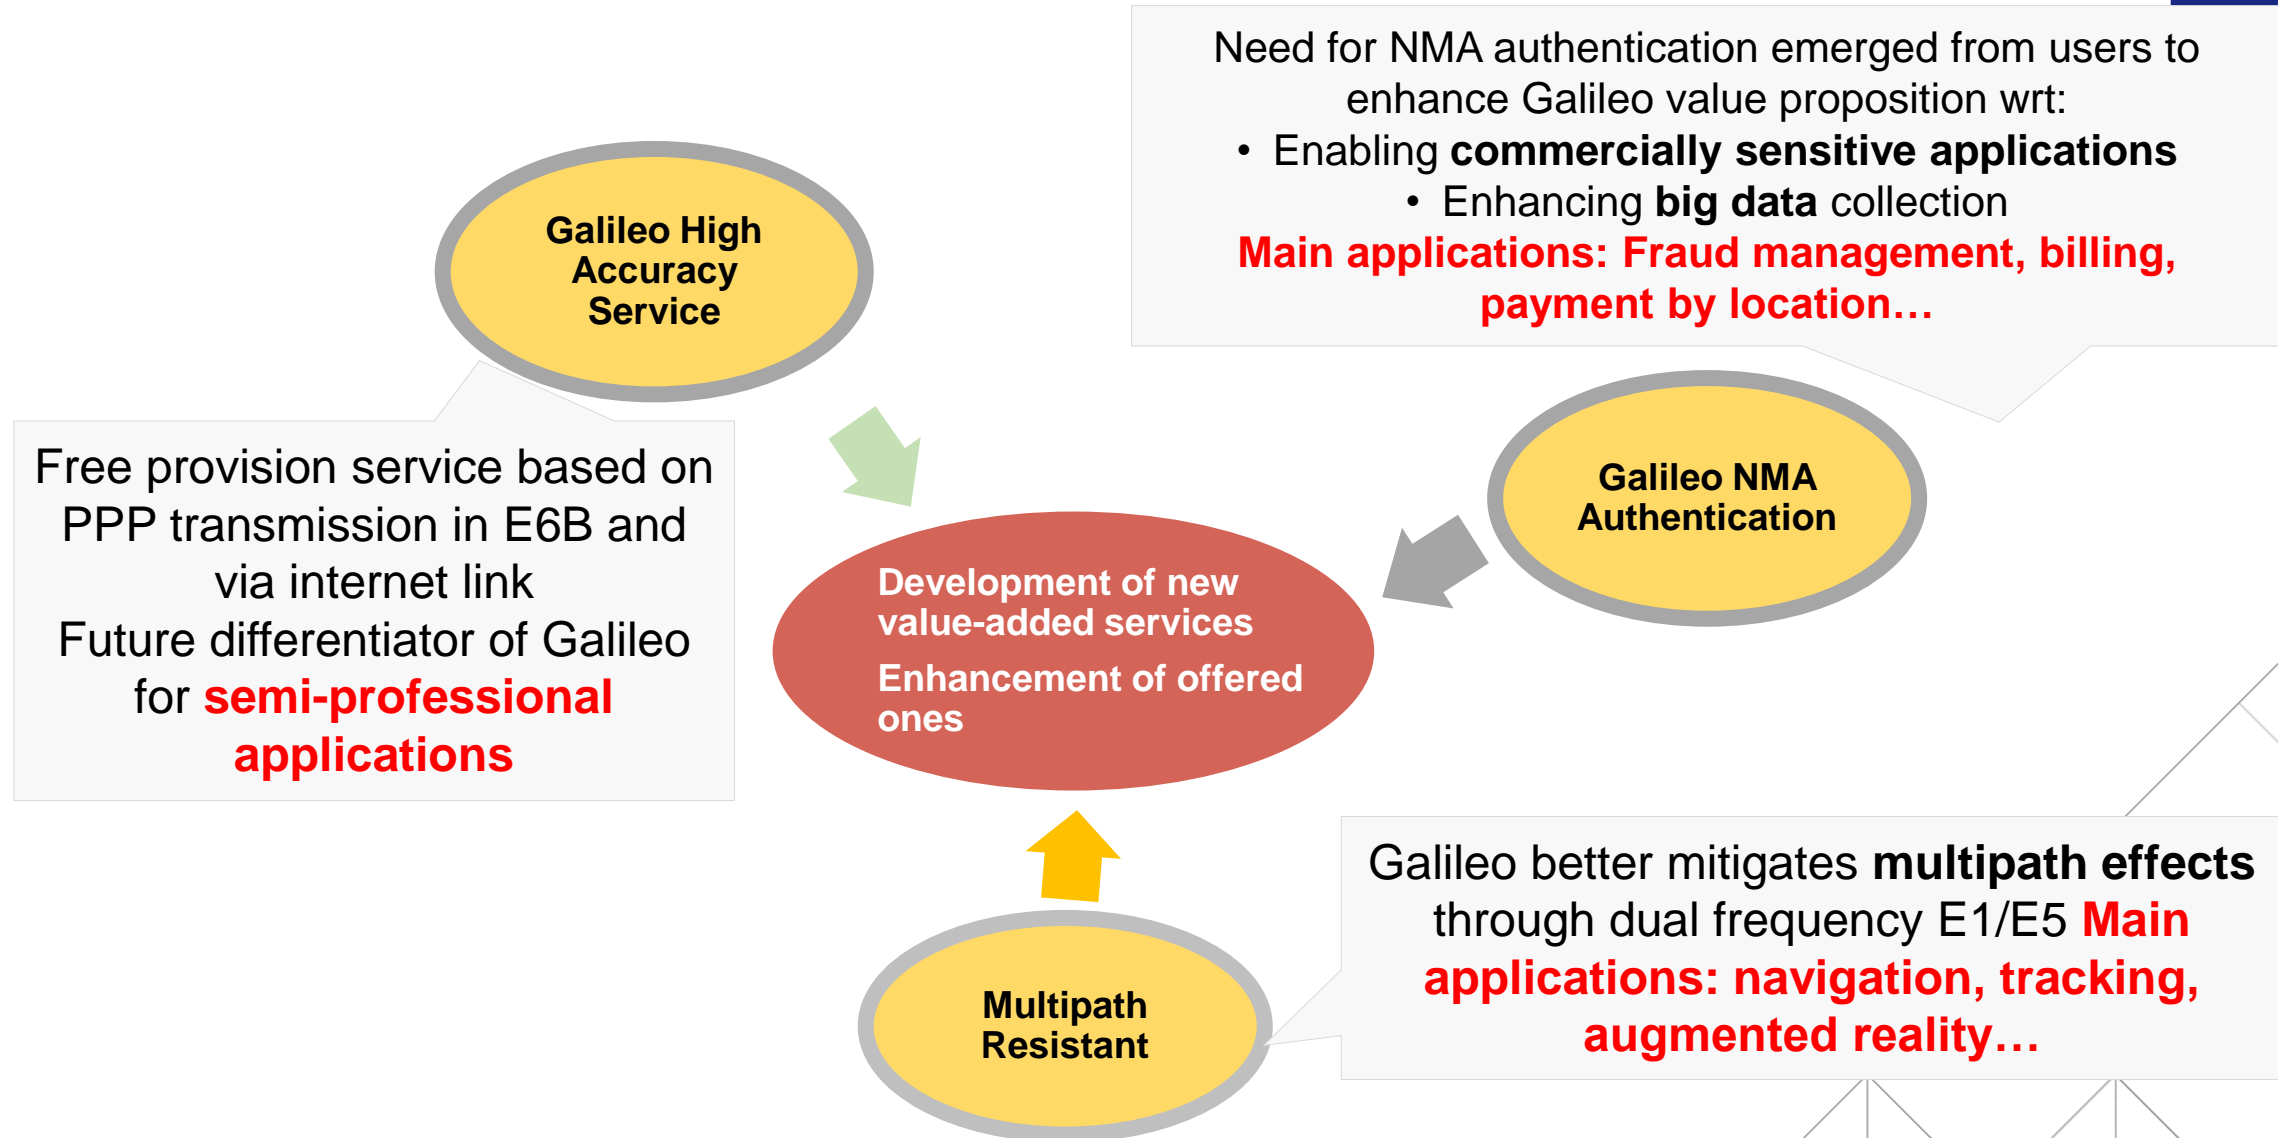

**HIGH PRECISION**  
 **NovAtel** **JAVAD** **Trimble** **TOPCON** **septentrio**

# A perspective of IoT from the GNSS point of view

# Summary of Galileo differentiators for IoT applications

# Linking space to user needs
